## Custom Fields Templates

Custom Fields display is being handled by the templates.

Before you start some basic HTML/CSS skills are needed.

Templates are located under the component templates directory path:

```
components/com_jomcomdev/templates/fields
```

By default there are 3 custom field templates:

- default.php [vertical]
- horizontal
- horizontal-float

When edited structure looks like this:

```
<ul class="jd-fields-ul ul-default">
  <li class="jd-fields-li<?=$idLabel?> li-default">
    <label class="jd-fields-li-label lab-default"><?=$this->_element->name?</label>
    <span class="jd-fields-li-value val-default"><?=$value?</span>
  </li>
</ul>
```

You can use any HTML structure and style using the component CSS files.

Custom Field styles are located in main component CSS file: assets/css/jomdirectory.css

## Set Custom Field Template

To assign a template to a custom field, edit custom field in component backend under Custom Fields, then just choose the desired template:

C Field Group

C Custom Field Template

Status

## Create a New Custom Field Template

Just copy one of the current templates, change name and edit. The new template appears under Custom Field Template.

You'll also need to create a corresponding translation in language file: components\com\_jomcomdev\language \en-GB\en-GB.com\_jomcomdev.ini change "en\_GB" in path to match your language.
